WASHINGTON TIMES 3 May 1985

Great wall divides intelligence units

By Tom Diaz

The United States can't properly identify international terrorist threats because its intelligence data is widely split among different agencies, a key Senate aide said yesterday.

"A kind of Chinese wall has been erected between [U.S.] foreign and domestic intelligence establishments," Angelo Codevilla, an aide to the Senate Intelligence Committee for seven years, told Washington Times editors and reporters.

He also said that the Soviet Union may be feeding false information to the United States in the form of data monitored "through technical intelligence collection," and stated that the Soviets could have been aided in learning how to do that by an article Assistant Secretary of State Richard Burt wrote in 1979, when he was a reporter for the New York Times.

Mr. Codevilla — widely regarded as an expert in intelligence matters — said the "Chinese wall" between U.S. intelligence agency data banks is sometimes breached, and information is exchanged when intelligence agencies learn of a specific case of threatened terrorism.

"But the trick is discovering that the case exists in the first place," he said. "And for that, unless one wishes to wait until the case bursts upon you in some violent way, counterintelligence analysis is necessary."

In order to conduct such analysis, he said, intelligence analysts must compare all the data available from different sources, both foreign and domestic.

"You can't do analysis or direction of any problem unless you have a sound common data base," he said. "There is nothing wrong with having 20 agencies involved, so long as all of them are working from the same deck and with some sort of central direction. In fact, there is none of that."

He gave the hypothetical example of a U.S. citizen who might travel to Mexico to engage in planning terrorist activities. Because of legal con-

straints on domestic intelligencegathering agencies, the FBI might not have been able to open an investigation into the person. Likewise, the Central Intelligence Agency might have no reason to connect the trip to terrorist activity. As a result, no specific "case" would be opened.

"Two sets of activities — here in the United States and in Mexico City — by this one individual, if put indicate the existence of a case," he said. "But the case won't be noticed because it is not possible for the two [agencies] to get together."

Mr. Codevilla said he would not recommend merging the two agen-

where all of the data from all of the agencies can be looked at from the perspective of counter-intelligence and counter-terrorism," he said. "But it isn't done, for bureaucratic reasons."

He cited the case of possible compromise of National Security Agency intelligence gathering as an example of a situation in which the intelligence bureaucracy has been reluctant to closely examine its own

problems.

"The NSA has invested billions in computers and state-of-the-art sensing equipment," he said. "It just so happens that the other side knows a few things about that equipment and may well be taking advantage of that knowledge to pass on certain information to us in ways advantageous

to them."

The super-secret NSA is known to be generally responsible for capturing and analyzing through electronic means foreign communications data, such as that sent over telephone lines, and radio and satellite transmissions.

"If there were a center of analysis independent of NSA that examined the validity of NSA sources, the wisdom of spending those billions would be questioned, further authorization for those billions would be cast into doubt and reputations might suffer," he said. "The point is that NSA wants very much to keep NSA sources evaluated by NSA people."

"And this is the case with all other intelligence agencies as well," he said, "It's not a question of national security; it's a question of bureaucratic security."

He suggested that there should be accentral point of review for evaluation of intelligence-agency operations, staffed by people "who look at it objectively."

"They ought to be independent in their careers," he said. "It matters less where they are than that they exist, and that they not believe that their further advancement will depend upon the goodwill of the people whose judgment they are called upon to evaluate."

Elaborating on his suggestion that the Soviets could be deliberately feeding data to NSA, Mr. Codevilla said a series of events could have given an opening to the Soviets.

The first was the turning over to the Soviets of "quite a number of conversations intercepted by NSA" and translated by British turncoat Geoffrey Prime, convicted in 1982 of spying for the Soviet Union.

"The Soviets, having this knowledge, had good reason to examine where the leak could have come from," he said. "They first would have asked themselves, how could these conversations have been intercepted?
